Not illustrated. 1922 Excerpt: .to the seventh groups, inclusive, the bases have the constitution:  $R, jMnX$ , where  $n$  is the valence of the element toward hydrogen. Thus, we have the organic bases:  $CH_3HgOH$ ,  $(CH_3)_2TlOH$ ,  $(CH_3)_3SnOH$ ,  $(CH_3)_4NOH$ ,  $(CH_3)_3SOH$  and  $(C H_5)_2IOH$ . The strength of the organic bases depends upon their constitution. As hydrogen is substituted by organic groups, particularly alkyl groups, the strength of the base in general increases, although a marked increase does not take place until the substitution of the last hydrogen atom occurs, in which case the resulting base exhibits a maximum strength. Thus, monomethyl-, dimethyl- and trimethylammonium hydroxides are comparatively weak bases, while tetramethylammonium hydroxide is a base whose strength is practically the same as that of potassium hydroxide. The positive ions of the strong organic bases possess distinct metallic characteristics in their compounds. With a few exceptions, these ionic groups may not be obtained in a free neutral state, since in this condition they are comparatively unstable, yielding, as a rule, various neutral organic compounds. The tetramethylammonium group, as indeed the ammonium group itself, possesses an appreciable stability. So, for example, the ammonium group forms an amalgam in which the presence of the free ammonium group has been established. The tetramethylammonium group forms a stable, solid, metallic amalgam with mercury,<sup>13</sup> and this group, moreover, may be precipitated in a free state by electrolysis in ammonia solution.<sup>19</sup> Under these conditions the free group dissolves in ammonia to form a solution which resembles solutions of the alkali metals in...
